<p>According to the applicant's requirements, the version of the normative reference used in this test report is specified by the applicant.</p> <p>Note 1: There are no Analogue/digital data ports on the EUT.</p>						

Declaration of Conformity:

1. The Radiated Emission and Conducted Transient Disturbances test result (Pass/Fail) which exclude measurement uncertainty.
Note that measurement values may risk exceeding the limit of regulation standard. If measurement uncertainty is included in test results.
2. The Radiated Emission and Conducted Transient Disturbances measurement uncertainty please refer to the "Measurement Uncertainty" section of the report.

Comments and explanations:

The test configuration and test mode were recorded in this test report are declared by the manufacturer.

1. General Description of Equipment under Test

1.1. Basic Description of Equipment under Test

Equipment : AC-DC Switching Power Supply
Model No. : TCI 240-112-T、TCI 240-124-T、TCI 240-148-T、TCI 240-112-J、TCI 240-124-J、
TCI 240-148-J、TCI 240-112U-T、TCI 240-124U-T、TCI 240-148U-T、
TCI 240-112U-J、TCI 240-124U-J、TCI 240-148U-J、TCI 240-112A-T、
TCI 240-124A-T、TCI 240-148A-T、TCI 240-112A-J、TCI 240-124A-J、
TCI 240-148A-J
Power Supply Type : Switching
AC Power Cord : Non-Shielded, 1.5 m, 3 pin (Conducted Emission)
Non-Shielded, 1.2 m, 3 pin (Radiated emission)
The maximum operating frequency : 150 kHz

1.2. Feature of Equipment under Test

For a more detailed features description, please refer to the manufacturer's specifications or the User's Manual.

1.3. Table for Multiple Listing

Model Name	Description
TCI 240-112-T、TCI 240-124-T、TCI 240-148-T、 TCI 240-112-J、TCI 240-124-J、TCI 240-148-J、 TCI 240-112U-T、TCI 240-124U-T、TCI 240-148U-T、 TCI 240-112U-J、TCI 240-124U-J、TCI 240-148U-J、 TCI 240-112A-T、TCI 240-124A-T、TCI 240-148A-T、 TCI 240-112A-J、TCI 240-124A-J、TCI 240-148A-J	The difference of models is in sales marketing, appearance and output connector.

Note: The information is provided by manufacturer.

2. Test Configuration of Equipment under Test

2.1. Details of EUT Test Modes

Model No.: TCI 240-112-T was selected as the main test model and its data was recorded in this report. The equipment under test was performed the following test modes:

Test Items	Description of test modes
Conducted Emission	Mode 1. FULL LOAD,AC IN 3 PIN Mode 2. FULL LOAD,AC IN 2 PIN cause "mode 1" generated the worst test result; it was reported as final data.
Radiated Emissions <below 1GHz>	Mode 1. FULL LOAD,AC IN 3 PIN Mode 2. FULL LOAD,AC IN 2 PIN cause "mode 1" generated the worst test result; it was reported as final data.

Test Items	Description of test modes
Harmonic and Flicker Emissions	Mode 1. FULL LOAD,AC IN 3 PIN
EMS	Mode 1. FULL LOAD,AC IN 3 PIN

2.2. Description of Test System

Conducted emission and radiated emission below 1GHz

No.	Peripheral	Manufacturer	Model Number	FCC ID	Remarks
For Local					
A	Dummy LOAD	N/A	N/A	N/A	Client provided

EMS

No.	Peripheral	Manufacturer	Model Number	Signal Cable	Cable Type	Length (m)	Remarks
For Local							
A	Dummy Load	N/A	N/A	-	-	-	Client provided
B	Multi-meter	YFE	YF-303	Probe Cable*2	Non-Shielded	1.2	-

2.3. Connection Diagram of Test System

2.4. Details of EUT Test Setup

The device under test was connected to the resistive load for testing in full load mode.

3.2. Test Standards

Test items	Test Standards and Test Procedures
Radiated and Conducted Emissions	European Standard EN 55032 Class A
Harmonics	European Standard EN IEC 61000-3-2
Voltage Fluctuations	European Standard EN 61000-3-3
EMS	European Standard EN 55035 (ESD: IEC 61000-4-2, RS: IEC 61000-4-3, EFT: IEC 61000-4-4, SURGES: IEC 61000-4-5, CS: IEC 61000-4-6, PFMF: IEC 61000-4-8, DIPs: IEC 61000-4-11)

3.3. Test Voltage/Frequencies

Power Supply Type	Voltage/Frequencies
AC Mains	230V / 50Hz

3.4. Test Distance and Frequency Range Investigated

Test Items	Frequency Range	Remark
Powerline Conducted Emissions	150 kHz to 30 MHz	-
Radiated Emissions (below 1GHz)	30 MHz to 1,000 MHz	Measurement distance is 10 m.
Radio frequency electromagnetic field immunity	80 to 1,000 MHz	Measurement distance is 3 m.
	1,800 MHz / 2,600 MHz / 3,500 MHz / 5,000 MHz	Measurement distance is 3 m.
Conducted immunity	150 kHz to 80 MHz	-

3.5. Operating Condition

- Customers request this specification for test plan.

3.6. Notice for Class A Product

This Notice is for class A product only. If the Equipment under Test is a class B product, this notice should be disregarded.

Class A ITE is a category of all other ITE which satisfies the class A ITE limits but not the class B ITE limits. Such equipment should not be restricted in its sale but the following warning shall be included in the instructions for use:

Warning

This equipment is compliant with Class A of CISPR 32. In a residential environment this equipment may cause radio interference.

4. Emissions Measurement

The EUT is which satisfies the Class A disturbance limits.

4.1. Conducted Emissions at Powerline

4.1.1. Limit

conducted emissions from the AC mains power ports of Class A equipment			
Frequency range MHz	Coupling device	Detector type / bandwidth	Class A limits dB(μ V)
0,15 – 0,5	AMN	Quasi-peak / 9 kHz	79
0,50 – 30			73
0,15 – 0,5	AMN	Average / 9 kHz	66
0,50 – 30			60

conducted emissions from the AC mains power ports of Class B equipment			
Frequency range MHz	Coupling device	Detector type / bandwidth	Class B limits dB(μ V)
0,15 – 0,5	AMN	Quasi-peak / 9 kHz	66 - 56
0,5 – 5			56
5 – 30			60
0,15 – 0,5	AMN	Average / 9 kHz	56 - 46
0,5 – 5			46
5 – 30			50

Note: The limit decreases linearly with the logarithm of the frequency in the range 0.15 MHz to 0.50 MHz.

4.1.2. Test Procedures

Tabletop equipment:

- a). The EUT was warmed up for 15 minutes before testing started.
- b). The EUT was placed on a desk 0.8 meter height from the metal ground plane and 0.4 meter from the conducting wall of the shielding room and it was kept at least 0.8 meter from any other grounded conducting surface.
- c). Connect EUT to the power mains through a line impedance stabilization network (LISN).
- d). All the support units are connect to the other LISN.
- e). The LISN provides 50 ohm, coupling impedance for the measuring instrument.
- f). The CISPR states that a 50 ohm, 50 microhenry LISN should be used.
- g). Both sides of AC line were checked for maximum conducted interference.
- h). The frequency range from 150 kHz to 30 MHz was searched.
- i). Set the test-receiver system to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode.
- j). All emissions not reported here are more than 10 dB below the prescribed limit.

Floor-standing equipment:

- a). The EUT was warmed up for 15 minutes before testing started.
- b). The EUT was placed on the horizontal ground reference plane, 0.15 meter above ground.
- c). Connect EUT to the power mains through a line impedance stabilization network (LISN).
- d). All the support units are connect to the other LISN.
- e). The LISN provides 50 ohm, coupling impedance for the measuring instrument.
- f). The CISPR states that a 50 ohm, 50 microhenry LISN should be used.
- g). Both sides of AC line were checked for maximum conducted interference.
- h). The frequency range from 150 kHz to 30 MHz was searched.
- i). Set the test-receiver system to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode.
- j). All emissions not reported here are more than 10 dB below the prescribed limit.

4.1.3. Measurement Results Calculation

The measured Level is calculated using:

$$\text{Corrected Reading (dB}\mu\text{V)} = \text{Raw(Read Level)} + (\text{LISN Factor}) + \text{CL(Cable Loss)} + \text{AT(Attenuator)}$$

For example at 0.3 MHz if the LISN Factor is 10.48 dB, the cable loss is 0.10 dB, the measured voltage is 36.39 dB μ V, attenuation 10dB, the signal strength would be calculated:

$$\text{Corrected Reading (dB}\mu\text{V)} = 36.39 \text{ dB}\mu\text{V} + 10.48 \text{ dB} + 0.10 \text{ dB} + 10 \text{ dB} = 56.97 \text{ dB}\mu\text{V}$$

4.1.4. Typical Test Setup Layout

- a). AMN is 80 cm from the EUT and at least 80 cm from other units and other metal planes.
- b). EUT is connected to one artificial mains network (AMN)
- c). All other units of a system are powered from a second AMN. A multiple outlet strip can be used for multiple mains cords.
- d). Rear of EUT to be flushed with rear of table top.
- e). Peripherals shall be placed at a distance of 10 cm from each other and from the controller, except for the monitor which, if this is an acceptable installation practice, shall be placed directly on the top of the controller.
- f). If cables, which hang closer than 40 cm to the horizontal metal ground plane, cannot be shortened to appropriate length, the excess shall be folded back and forth forming a bundle 30 cm to 40 cm long.
- g). Mains cords and signal cables shall be positioned for their entire lengths, as far as possible, at 40 cm from the vertical reference plane.
- h). Cables of hand operated devices, such as keyboards, mice, etc. shall be placed as for normal usage.

4.2. Radiated Emission below 1GHz

4.2.1.Limit

radiated emissions at frequencies up to 1 GHz for Class A equipment			
Frequency range MHz	Measurement		Class A limits dB(µV/m)
	Distance (m)	Detector type / bandwidth	OATS/SAC
30 – 230	10	Quasi Peak / 120 kHz	40
230 – 1000			47
30 – 230	3		50
230 – 1000			57

radiated emissions at frequencies up to 1 GHz for Class B equipment			
Frequency range MHz	Measurement		Class B limits dB(µV/m)
	Distance (m)	Detector type / bandwidth	OATS/SAC
30 – 230	10	Quasi Peak / 120 kHz	30
230 – 1000			37
30 – 230	3		40
230 – 1000			47

4.2.2. Test Procedures

Tabletop equipment

- a). The EUT was placed on a rotatable table top 0.8 meter above ground.
- b). The EUT was set 10 meters from the interference-receiving antenna which was mounted on the top of a variable height antenna tower.
- c). The table was rotated 360 degrees to determine the position of the highest radiation.
- d). The antenna is a half wave dipole and its height is varied between one meter and four meters above ground to find the maximum value of the field strength both horizontal polarization and vertical polarization of the antenna are set to make the measurement.
- e). For each suspected emission the EUT was arranged to its worst case and then tune the antenna tower (from 1 M to 4 M) and turn table (from 0 degree to 360 degrees) to find the maximum reading.
- f). Set the test-receiver system to Peak Detect Function and specified bandwidth with Maximum Hold Mode.
- g). If the emission level of the EUT in peak mode was 3 dB lower than the limit specified, then testing will be stopped and peak values of EUT will be reported, otherwise, the emissions which do not have 3 dB margin will be repeated one by one using the quasi-peak method and reported.
- h). The central point of the EUT shall be positioned at the center of the turntable. The measurement distance is the shortest horizontal distance between an imaginary circular periphery just encompassing this arrangement and the calibration point of the antenna.
- i). If the EUT is having a Wireless modular, can choose to install the filter at the input connector of test-receiver system.

Floor-standing equipment:

- a). The EUT was placed on the horizontal ground reference plane, 0.15 meter above ground.
- b). The EUT was set 10 meters from the interference-receiving antenna which was mounted on the top of a variable height antenna tower.
- c). The table was rotated 360 degrees to determine the position of the highest radiation.
- d). The antenna is a half wave dipole and its height is varied between one meter and four meters above ground to find the maximum value of the field strength both horizontal polarization and vertical polarization of the antenna are set to make the measurement.
- e). For each suspected emission the EUT was arranged to its worst case and then tune the antenna tower

- (from 1 M to 4 M) and turn table (from 0 degree to 360 degrees) to find the maximum reading.
- f). Set the test-receiver system to Peak Detect Function and specified bandwidth with Maximum Hold Mode.
 - g). If the emission level of the EUT in peak mode was 3 dB lower than the limit specified, then testing will be stopped and peak values of EUT will be reported, otherwise, the emissions which do not have 3 dB margin will be repeated one by one using the quasi-peak method and reported.
 - h). The central point of the EUT shall be positioned at the centre of the turntable. The measurement distance is the shortest horizontal distance between an imaginary circular periphery just encompassing this arrangement and the calibration point of the antenna.
 - i). If the EUT is having a Wireless modular, can choose to install the filter at the input connector of test-receiver system.

4.2.3. Measurement Results Calculation

The measured Level is calculated using:
Corrected Reading (dB μ V/m) = Antenna Factor + Cable Loss + Read Level – Preamp Factor
For example at 125 MHz if the Antenna Factor is 17.24 dB/m, the cable loss is 1.20 dB, the measured voltage is 35.80 dB μ V and the Preamp Factor is 27.18 dB, the signal strength would be calculated:
Corrected Reading (dB μ V/m) = 17.24 dB/m + 1.20 dB + 35.80 dB μ V - 27.18 dB = 27.06 dB μ V/m
Note: If a hybrid antenna is used, the antenna factor shall be the sum of the Antenna Factor + Attenuator Factor.

4.2.4. Typical Test Setup Layout

4.2.5. Test Result

4.3. Harmonic Current Emissions Measurement

4.3.1. Limit

Harmonic current emissions evaluate the potential for the EUT to cause distortion on the AC power lines. It is applicable to electrical and electronic equipment having an input current ≤ 16 A per phase, and intended to be connected to public low-voltage distribution systems.

Harmonics [n]	Class A [A]	Class B [A]	Class C [% of fund]	Class D [mA/W]
Odd harmonics				
3	2.30	3.45	30 x λ	3.4
5	1.14	1.71	10	1.9
7	0.77	1.155	7	1.0

4.4. Voltage Fluctuations and Flicker Measurement

4.4.1. Limit

The objective of voltage changes, voltage fluctuations and flicker in public low voltage supply systems during equipment with rated current ≤ 16 A per phase, ensures that home appliances and certain other electrical equipment do not adversely affect lighting equipment when connected to the same power system.

Voltage Fluctuation and Flicker Limits:

- The value of P_{st} shall not be greater than 1.0.
- The value of P_{it} shall not be greater than 0.65.
- The value of $d(t)$ during a voltage change shall not exceed 3.3 % for more than 500 ms.
- The relative steady-state voltage change, d_c , shall not exceed 3.3 %.
- The maximum relative voltage change, d_{max} , shall not exceed 4.0 %.

4.4.2. Test Procedure

The test procedures followed are those specified in EN 61000-3-3:2013+A1:2019.

4.4.3. Test Equipment Settings

Flicker Parameters	Setting
Line Voltage	230 V

5. Immunity Measurement

5.1. General performance criteria

Applicable Standard: EN 55035	
Criteria A	The equipment shall continue to operate as intended without operator intervention. No degradation of performance, loss of function or change of operating state is allowed below a performance level specified by the manufacturer when the equipment is used as intended. The performance level may be replaced by a permissible loss of performance. If the minimum performance level or the permissible performance loss is not specified by the manufacturer, then either of these may be derived from the product description and documentation, and by what the user may reasonably expect from the equipment if used as intended.
Criteria B	During the application of the disturbance, degradation of performance is allowed. However, no unintended change of actual operating state or stored data is allowed to persist after the test. After the test, the equipment shall continue to operate as intended without operator intervention; no degradation of performance or loss of function is allowed, below a performance level specified by the manufacturer, when the equipment is used as intended. The performance level may be replaced by a permissible loss of performance. If the minimum performance level (or the permissible performance loss), or recovery time, is not specified by the manufacturer, then either of these may be derived from the product description and documentation, and by what the user may reasonably expect from the equipment if used as intended.
Criteria C	Loss of function is allowed, provided the function is self-recoverable, or can be restored by the operation of the controls by the user in accordance with the manufacturer's instructions. A reboot or re-start operation is allowed. Information stored in non-volatile memory, or protected by a battery backup, shall not be lost.

5.2. Electrostatic Discharge (ESD)

5.2.1. Test Specification

Reference Standard	IEC 61000-4-2
Discharge Impedance	330 Ω / 150 pF
Polarity	Positive and negative
Single Discharge Mode	1 discharge per 1s

5.2.2. Test Levels

Contact discharge		Air Discharge	
Level	Test Voltage kV	Level	Test Voltage kV
1	2	1	2
2	4	2	4
3	6	3	8
4	8	4	15
x	Specified	x	Specified

Remark : "x" can be any level, above, below or in between the others. The level shall be specified in the dedicated equipment specification. If higher voltages than those shown are specified, special test equipment may be needed.

5.2.3. Test Procedure

- a. In the case of air discharge testing the climatic conditions shall be within the following ranges:
 - ambient temperature: 15 °C to 35 °C;
 - relative humidity : 30 % to 60 %;
 - atmospheric pressure : 86 kPa (860 mbar) to 106 kPa (1060 mbar).
- b. Test programs and software shall be chosen so as to exercise all normal modes of operation of the EUT. The use of special exercising software is encouraged, but permitted only where it can be shown that the EUT is being comprehensively exercised.
- c. The test voltage shall be increased from the minimum to the selected test severity level, in order to determine any threshold of failure. The final severity level should not exceed the product specification value in order to avoid damage to the equipment.
- d. For the time interval between successive single discharges an initial value of one second is recommended. Longer intervals may be necessary to determine whether a system failure has occurred.
- e. In the case of contact discharges, the tip of the discharge electrode shall touch the EUT before the discharge switch is operated.
- f. In the case of painted surface covering a conducting substrate, the following procedure shall be adopted:
 - If the coating is not declared to be an insulating coating by the equipment manufacturer, then the pointed tip of the generator shall penetrate the coating so as to make contact with the conducting substrate.
 - Coating declared as insulating by the manufacturer shall only be submitted to the air discharge.
 - The contact discharge test shall not be applied to such surfaces.
- g. In the case of air discharges, the round discharge tip of the discharge electrode shall be approached as fast as possible (without causing mechanical damage) to touch the EUT. After each discharge, the ESD generator (discharge electrode) shall be removed from the EUT. The generator is then retriggered for a new single discharge. This procedure shall be repeated until the discharges are completed. In the case of an air discharge test, the discharge switch, which is used for contact discharge, shall be closed.

5.2.4. Test Setup

The test setup consists of the test generator, EUT and auxiliary instrumentation necessary to perform DIRECT and INDIRECT application of discharges to the EUT as applicable, in the follow manner:

- a). CONTACT DISCHARGE to the conductive surfaces and to coupling plane;
- b). AIR DISCHARGE at insulating surfaces.

The preferred test method is that of type tests performed in laboratories and the only accepted method of demonstrating conformance with this standard. The EUT was arranged as closely as possible to arrangement in final installed conditions.

5.2.5. Test Setup for Tests Performed in Laboratory

A ground reference plane was provided on the floor of the test site. It was a metallic sheet (copper or aluminum) of 0.25 mm, minimum thickness; other metallic may be used but they shall have at least 0.65 mm thickness. In the Hsinhua LAB., we provided 1 mm thickness aluminum ground reference plane or 1 mm thickness stainless steel ground reference plane. The minimum size of the ground reference plane is 1 m x 1 m, the exact size depending on the dimensions of the EUT. It was connected to the protective grounding system.

The EUT was arranged and connected according to its functional requirements. A distance of 1 m minimum was provided between the EUT and the wall of the Lab., and any other metallic structure. In cases where this length exceeds the length necessary to apply the discharges to the selected points, the excess length shall, where possible, be placed non-inductively off the ground reference plane and shall not come closer than 0.2 m to other conductive parts in the test setup.

Tabletop equipment:

Where the EUT is installed on a metal table, the table was connected to the reference plane via a cable with a 470k ohm resistor located at each end, to prevent a build-up of charge. The test setup was consist a wooden table, 0.8 m high, standing on the ground reference plane. A HCP, 1.6 m x 0.8 m, was placed on the table. The EUT and cables was isolated from the HCP by an insulating support 0.5 mm thick. The VCP size, 0.5 m x 0.5 m.

Floor-standing equipment:

The EUT shall be isolated from the ground reference plane by an insulating support of 0,05 m to 0,15 m thick. The EUT cables shall be isolated from the ground reference plane by an insulating support of $(0,5 \pm 0,05)$ mm. This cable isolation shall extend beyond the edge of the EUT isolation.

The VCP size, 0.5 m x 0.5 m

**5.2.6. Test Result**

5.3. Radio Frequency Electromagnetic Field (RS)

5.3.1. Test Specification

Reference Standard	IEC 61000-4-3
Dwell Time	2.9 seconds
Frequency Step size	1 % of the preceding frequency value
Antenna Polarity	Vertical and Horizontal

5.3.2. Test Levels

Level	Test field strength V/m
1	1
2	3
3	10
4	30
x	Specified

Remark : "x" is an open test level and the associated field strength may be any value. This level may be given in the product standard.

If the audio output function needs to be test, the function should be maintained and the following requirements should be met

Performance criterion A – Limits for devices supporting telephony					
Type of immunity test	Frequency range MHz	Acoustic or electrical interference ratio	Equivalent direct measurement		
			dB(SPL)	Digital dBm0	Analogue dBm
Radiated	80 to 1,000	0dB	75	-30	-30
<p>The equivalent direct measurement values are presented to show the equivalency of the interference ratio in comparison to a direct measured value. These values may be used if the direct measurement method of the test is used.</p> <p>The values within this table are aligned with CISPR 24, noting that the test levels are different between this document and CISPR 24.</p> <p>For terminals connected to digital wired network ports (such as Ethernet, ISDN), measurements of the demodulated 1 kHz may be performed on a remote AE, ideally of the same design.</p>					
MME not supporting telephony reference level					
<p>A level within the expected dynamic range of the audio output, as intended by the manufacturer and is: at least 10 dB below the highest peak reproduced audio level occurring in normal use; and, below the highest level of reproduced audio that can be continuously output in normal use.</p> <p>The measured acoustic interference ratio and/or the measured electrical interference ratio during the test shall be -20 dB or better.</p>					

5.3.3. Test Procedure

- a). The equipment to be tested is placed in the center of the enclosure on a wooden table. The equipment is then connected to power and signal leads according to pertinent installation instructions.
- b). The bilog antenna which is enabling the complete frequency range of 80 to 1000 MHz, The horn antenna which is enabling the complete frequency range 1000 to 5000 MHz is placed 3m away from the equipment. The required field strength is determined by placing the field strength meter(s) on top of or directly alongside the equipment under test and monitoring the field strength meter via a remote field strength indicator outside the enclosure while adjusting the continuous-wave to the applicable antennae.
- c). The test is normally performed with the generating antenna facing each of four sides of the EUT. The polarization of the field generated by the broadband (bilog) antenna necessitates testing each position twice, once with the antenna positioned vertically and again with the antenna positioned horizontally.
- d). The dwell time at each frequency shall not be less than the time necessary for the EUT to be exercised, and able to respond. Sensitive frequencies e.g. clock frequency(ies) and harmonics or frequencies of dominant interest shall be analyzed separately.
- e). At each of the above conditions, the frequency range is swept 80 to 5000 MHz, pausing to adjust the R.F. signal level or to switch oscillators and antenna. The rate of sweep is in the order of 1.5×10^{-3} decades/s. The sensitive frequencies or frequencies of dominant interest may be discretely analyzed.

5.3.4. Test Setup

NOTE : The SPORTON 7m x 4m x 4m semi-anechoic chamber is compliance with the sixteen point's uniform field requirement as stated in IEC 61000-4-3 Section 6.2.

The procedure defined in this part requires the generation of electromagnetic fields within which the test sample is placed and its operation observed. To generate fields that are useful for simulation of actual (field) conditions may require significant antenna drive power and the resultant high field strength levels. To comply with local regulations and to prevent biological hazards to the testing personnel, it is recommended that these tests be carried out in a shielded enclosure or semi-anechoic chamber.

**5.3.5. Test Result**

Test mode	Mode 1		
Applicable Standard	EN 55035:2017+A11:2020	Final Test Result	PASS
Frequency Range(swept)	80 to 1000 MHz		
Frequency Range(spot)	1800,2600,3500,5000 MHz ($\pm 1\%$)		
Electromagnetic field	3 V/m (unmodulated, r.m.s)		
Amplitude modulated	80% AM (1 kHz)		
Performance Criteria	A		

Frequency Range MHz	Test field strength V/m	Antenna Polarization	Azimuth Degree	Test Result (Criteria)	Remark
80~1000	3	V&H	0, 90, 180, 270	A	-
1800	3	V&H	0, 90, 180, 270	A	-
2600	3	V&H	0, 90, 180, 270	A	-
3500	3	V&H	0, 90, 180, 270	A	-
5000	3	V&H	0, 90, 180, 270	A	-

5.4. Electrical Fast Transient/Burst (EFT/B)

5.4.1. Test Specification

Reference Standard	IEC 61000-4-4
Polarity	positive/negative
Repetition Rate	1 time / minute

5.4.2. Test Levels

Open circuit output test voltage and repetition frequency of the impulses				
Level	Power ports, earth port (PE)		Signal and control ports	
	Voltage peak kV	Repetition frequency kHz	Voltage peak kV	Repetition frequency kHz
1	0.5	5 or 100	0.25	5 or 100
2	1	5 or 100	0.5	5 or 100
3	2	5 or 100	1	5 or 100
4	4	5 or 100	2	5 or 100
X	Specified	Specified	Specified	Specified

The use of 5 kHz repetition frequency is traditional, however, 100 kHz is closer to reality. Product committees should determine which frequencies are relevant for specific products or product types. With some products, there may be no clear distinction between power ports and signal ports, in which case it is up to product committees to make this determination for test purposes.

Remark : " x " can be any level, above, below or in between the others. The level shall be specified in the dedicated equipment specification.

5.4.3. Test Procedure

- a). In order to minimize the effect of environmental parameters on test results, the electromagnetic environment of the laboratory shall not influence the test results.
- b). The variety and diversity of equipment and systems to be tested make it difficult to establish general criteria for the evaluation of the effects of fast transients/bursts on equipment and systems.
- c). The test results may be classified on the basis of the operating conditions and the functional specification of the equipment under test, according to the following performance criteria :
 - Normal performance within the specification limits.
 - Temporary degradation or loss of function or performance which is self-recoverable.
 - Temporary degradation or loss of function or performance which requires operator intervention or system reset.
 - Degradation or loss of function which is not recoverable due to damage of equipment (components).

5.4.4. Test setup

- (A) location for supply line coupling
- (B) location for signal lines coupling

The EUT was placed on a ground reference plane and was insulated from it by an insulating support about 0.1 m thick. If the EUT is table-top equipment, it was located approximately 0.8 m above the GRP. The GRP. Was a metallic sheet (copper or aluminum) of 0.25 mm, minimum thickness; other metallic may be used but they shall have at least 0.65 mm thickness. It shall project beyond the EUT by at least 0.1 m on all sides and connected to the protective earth. In the Hsinhua LAB., We provided 1 mm thickness aluminum ground reference plane or 1 mm thickness stainless steel ground reference plane. The minimum size of the ground reference plane is 1 m x 1 m, the exact size depending on the dimensions of the EUT. It was connected to the protective grounding system. The EUT was arranged and connected according to its functional requirements. The minimum distance between the EUT and other conductive structures, except the GRP. Beneath the EUT, was more than 0.5 m. using the coupling clamp, the minimum distance between the coupling plates and all other conductive structures, except the GRP. Beneath the EUT, was more than 0.5 m. The length of the signal and power lines between the coupling device and the EUT was 0.5 m or less.

5.4.5. Test on Power Line

- a). The EFT/B-generator was located on the GRP. The length from the EFT/B-generator to the EUT as not exceeds 0.5 m.
- b). The EFT/B-generator provides the ability to apply the test voltage in a non-symmetrical condition to the power supply input terminals of the EUT.

5.4.6. Test on Communication Lines

- a). The coupling clamp is composed of a clamp unit for housing the cable (length more than 3 m), and was placed on the GRP.
- b). The coupling clamp provides the ability of coupling the fast transient/bursts to the cable under test.

**5.4.7. Test Result**

Test mode	Mode 1		
Applicable Standard	EN 55035:2017+A11:2020	Final Test Result	PASS
Test Voltage	Input AC power ports: 1.0 kV		
Impulse wave shape	5/50 ns (Tr/Th)		
Repetition frequency	5 kHz		
Performance Criteria	B		

Test Result - Input a.c. power ports:

Test Location	Test Voltage kV	Test Result (Criteria)		Remark
		pos. (+)	neg. (-)	
L+N+PE	1.0	A	A	-

Remark : PE = Earth reference

5.5. Surges

5.5.1. Test Specification

Reference Standard	IEC 61000-4-5
Polarity	positive/negative
Phase Angle	90°, 270° (AC power port)
Number of surges	5 positive and 5 negative pulses
Test Repetition Rate	1 time / minute

5.5.2. Test Levels

Level	Open-circuit test voltage kV	
	Line-to-line	Line-to-ground *
1	-	0.5
2	0.5	1.0
3	1.0	2.0
4	2.0	4.0
x	Specified	Specified

Remark : " x " can be any level, above, below or in between the others. The level shall be specified in the dedicated equipment specification.

" * "For symmetrical interconnection lines the test can be applied to multiple lines simultaneously with respect to ground, i.e. "lines to ground".

5.5.3. Test Procedure

- a). Electromagnetic conditions:
The electromagnetic environment of the laboratory shall not influence the test results.
- b). The test shall be performed according the test plan that shall specify the test set-up with
 - generator and other equipment utilized;
 - test level (voltage/current);
 - generator source impedance;
 - internal or external generator trigger;
 - number of tests : at least five positive and five negative at the selected points;
 - repetition rate : maximum 1/min.
 - inputs and outputs to be tested;
 - representative operating conditions of the EUT;
 - sequence of application of the surge to the circuit;
 - phase angle in the case of a.c. power supply;
 - actual installation conditions, for example:
AC : neutral earthed,
DC : (+) or (-) earthed to simulated the actual earthing conditions.
- c). If not otherwise specified the surges have to be applied synchronized to the voltage phase at the zero-crossing and the peak value of the a.c. voltage wave (positive and negative).
- d). The surges have to be applied line to line and line(s) and earth. When testing line to earth, the test voltage has to be applied successively between each of the lines and earth, if there is no other specification.
- e). The test procedure shall also consider the non-linear current-voltage characteristics of the equipment under test. Therefore the test voltage has to be increased by steps up to the test level specified in the product standard or test plan.
- f). All lower levels including the selected test level shall be satisfied. For testing the secondary protection, the output voltage of the generator shall be increased up to the worst-case voltage breakdown level (let-through level) of the primary protection.
- g). If the actual operating signal sources are not available, they may be simulated. Under no circumstances may the test level exceed the product specification. The test shall be carried out according the test plan.
- h). To find all critical points of the duty cycle of the equipment, a sufficient number of positive and negative test pulses shall be applied. For acceptance test previously unstressed equipment shall be used to the protection devices shall be replaced.

**5.5.4. Test Result**

Test mode	Mode 1		
Applicable Standard	EN 55035:2017+A11:2020	Final Test Result	PASS
Test Voltage	Input AC power ports: line to line: 1.0 kV; line to earth or ground: 2.0 kV		
Impulse wave shape	Input a.c. power ports: 1,2/50 (8/20) Tr/Th μ s		
Performance Criteria	Input a.c. power ports: B		

Test Result - Input a.c. power ports:

Test Location	Test Voltage kV	Polarity pos. / neg.	Test Result (Criteria)		Remark
			Phase Angle (Degree)		
			90°	270°	
L - N	1.0	+ / -	A	A	-
L - PE	2.0	+ / -	A	A	-
N - PE	2.0	+ / -	A	A	-

Remark : PE = Earth reference

5.6. Conducted Disturbances Induced by Radio-Frequency Field (CS)

5.6.1. Test Specification

Reference Standard	IEC 61000-4-6
Dwell Time	2.9 seconds
Frequency Step size	1 % of the preceding frequency value

5.6.2. Test Levels

Frequency range 150 kHz – 80 MHz		
Level	Voltage level (e.m.f.)	
	U_0 dB(μ V)	U_0 V
1	120	1
2	129.5	3
3	140	10
x	Specified	

Remark : " x " is an open level.

If the audio output function needs to be test, the function should be maintained and the following requirements should be met

Performance criterion A – Limits for devices supporting telephony					
Type of immunity test	Frequency range MHz	Acoustic or electrical interference ratio	Equivalent direct measurement		
			dB(SPL)	Digital dBm0	Analogue dBm
Conducted ^a	0,15 to 30	-20 dB	55	-50	-50
	30 to 80	-10 dB	65	-40	-40

^a At the step in the frequency range, the lower limit shall be applied.
 The equivalent direct measurement values are presented to show the equivalency of the interference ratio in comparison to a direct measured value. These values may be used if the direct measurement method of the test is used.
 The values within this table are aligned with CISPR 24, noting that the test levels are different between this document and CISPR 24.
 For terminals connected to digital wired network ports (such as Ethernet, ISDN), measurements of the demodulated 1 kHz may be performed on a remote AE, ideally of the same design.

MME not supporting telephony reference level

A level within the expected dynamic range of the audio output, as intended by the manufacturer and is: at least 10 dB below the highest peak reproduced audio level occurring in normal use; and, below the highest level of reproduced audio that can be continuously output in normal use.
 The measured acoustic interference ratio and/or the measured electrical interference ratio during the test shall be -20 dB or better.

5.6.3. Test Procedure

- a). The EUT shall be operated within its intended climatic conditions. The temperature and relative humidity should be recorded.
- b). This test method test can be performed without using a sell shielded enclosure. This is because the disturbance levels applied and the geometry of the setups are not likely to radiated a high amount of energy, especially at the lower frequencies. If under certain circumstances the radiated energy is too high, a shielded enclosure has to be used.
- c). The test shall be performed with the test generator connected to each of the coupling and decoupling devices in turn while the other non-excited RF-input ports of the coupling devices are terminated by a 50 ohm load resistor.
- d). The frequency range is swept from 150 kHz to 80 MHz, using the signal levels established during the setting process, and with the disturbance signal 80% amplitude modulated with a 1kHz sine wave, pausing to adjust the RF-signal level or to switch coupling devices as necessary. The rate of sweep shall no exceed 1.5×10^{-3} decades/s. Where the frequency is swept incrementally, the step size shall no exceed 1% of the start and thereafter 1% of the preceding frequency value.
- e). The dwell time at each frequency shall not be less than the time necessary for the EUT to be exercised, and able to respond. Sensitive frequencies e.g. clock frequency(ies) and harmonics or frequencies of dominant interest shall be analyzed separately.
- f). In cases of dispute, the test procedure using a step size not exceeding 1% of the start and thereafter 1% of preceding frequency value shall take precedence.
- g). Attempts should be made to fully exercise the EUT during testing, and to fully interrogate all exercise modes selected for susceptibility.
- h). The use of special exercising programs is recommended.
- i). Testing shall be performed according to a Test Plan, which shall be included in the test report.
- j). It may be necessary to carry out some investigatory testing in order to establish some aspects of the test plan.

**5.6.4. Test Result**

Test mode	Mode 1			
Applicable Standard	EN 55035:2017+A11:2020	Final Test Result	PASS	
Frequency Range	0.15 to 10 MHz 10 to 30 MHz 30 to 80 MHz 0.15 to 80 MHz (For applicant Requirement)			
Test Voltage	3 V 3 to 1 V 1 V	unmodulated, r.m.s		
Amplitude modulated	80% AM (1 kHz)			
Performance Criteria	A			

Frequency Range MHz	Test Voltage V rms	CDN	Test Port	Test Result (Criteria)	Remark
0.15 ~ 10	3	CDN-M016 SW M3	Input power port(AC)	A	-
10 ~ 30	3 ~ 1	CDN-M016 SW M3	Input power port(AC)	A	-

0.15 ~ 80	3	CDN-M016 SW M3	Input power port(AC)	A	-

5.7. Power Frequency Magnetic Field (PFMF)

5.7.1. Test Specification

Reference Standard	IEC 61000-4-8
Frequency Range	50 or 60 Hz
Inductance Coil	1 m x 1 m

5.7.2. Test Levels

Level	Magnetic field strength A/m
1	1
2	3
3	10
4	30
5	100
x	Specified

Remark : " x " can be any level, above, below or in-between the other levels. This level can be given in the product specification.

5.7.3. Test Procedure

- a). The equipment is configured and connected to satisfy its functional requirements.
- b). The power supply, input and output circuits shall be connected to the sources of power supply, control and signal.
- c). The cables supplied or recommended by the equipment manufacturer shall be used. 1 meter of all cables used shall be exposed to the magnetic field.

5.7.4. Test Setup

5.7.5. Test Result

Test mode	Mode 1		
Applicable Standard	EN 55035:2017+A11:2020	Final Test Result	PASS
Power-frequency	50 Hz	Magnetic field	1 A/m (r.m.s.)
Performance Criteria	A		

Power Frequency Magnetic Field	Testing duration	Coil Orientation	Test Result (Criteria)	Remark
50Hz, 1A/m	1.0 Min	X-axis	A	-
50Hz, 1A/m	1.0 Min	Y-axis	A	-
50Hz, 1A/m	1.0 Min	Z-axis	A	-

5.8. Voltage Dips and Voltage Interruptions (DIPs)

5.8.1. Test Specification

Reference Standard	IEC 61000-4-11
Phase shifting	0° / 180°
Test of interval	10 sec
Level and duration	Sequence of 3 dips/interrupts
Voltage rise (and fall) time	1 ~ 5 μ s

5.8.2. Test Levels

The voltages in this standard use the rated voltage for the equipment (U_T) as a basis for voltage test level specification.

Where the equipment has a rated voltage range the following shall apply:

- if the voltage range does not exceed 20 % of the lower voltage specified for the rated voltage range, a single voltage within that range may be specified as a basis for test level specification (U_T);
- in all other cases, the test procedure shall be applied for both the lowest and highest voltages declared in the voltage range;

5.8.3. Testing Requirement and Procedure

The test was based on IEC 61000-4-11.

5.8.4. Test Result

Test mode	Mode 1		
Applicable Standard	EN 55035:2017+A11:2020	Final Test Result	PASS
Voltage dips	<5% residual; 0,5 period		
	70% residual; 25 periods for 50Hz; 30 periods for 60Hz		
Voltage interruptions	<5% residual; 250 periods for 50Hz; 300 periods for 60Hz		
Performance Criteria	B/C/C		

Test Result of 100V/50Hz
