We, **International Standards Laboratory Corp.**, hereby certify that:

The device bearing the trade name and model specified above has been shown to comply with the applicable technical standards as indicated in the measurement report. And Our laboratories is the accredited laboratories and are approved according to ISO/IEC 17025. The device was passed the test performed according to:

## Standards:

EN 50155:2017 for EMC, Environmental and Characteristic  
EN 50121-3-2:2016+A1:2019 for EMC  
EN 60068-2-1:2007 for Environmental  
EN 60068-2-2:2007 for Environmental  
EN 60068-2-30:2005 for Environmental  
EN 61373:2010 for Environmental

I attest to the accuracy of data and all measurements reported herein were performed by me or were made under my supervision and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements and vouch for the qualifications of all persons taking them.

The determination of the test results is determined by customer agreement, regulations or standard document specifications.

The Laboratory evaluates measurement inaccuracies based on regulatory or standard document specifications and is listed in the report for reference. The quantitative project part judges the conformity of the test results based on the evaluation results of the standard cited uncertainty, and the qualitative project does not temporarily evaluate the measurement uncertainty.

### 1.2.1 Performance Criteria for Compliance

#### Performance criterion A:

The apparatus shall continue to operate as intended during and after the test/event. No degradation of performance or loss of function is allowed.

Changes of actual operating state or stored data are not allowed.

If agreed between the involved parties, the normal performance level (all functions are working as specified) can be replaced by a minimum performance level.

#### Performance criterion B:

The apparatus shall continue to operate as intended after the test/event.

During the test/event, degradation of performance is however allowed.

Changes of actual operating state or stored data are not allowed.

#### Performance criterion C:

During the test/event temporary loss of function is allowed. The equipment could:

- automatically restart. The normal performance shall be obtained within a maximum defined time.

After this time the equipment shall retain the previous operating state and shall work as intended.

The loss of significant data is not allowed; or

- manually restart or process controlled restart. In this case this shall be agreed between user and supplier and/or clearly defined in the user manual. In this case the user manual shall be available to the user at the tender stage.

NOTE Significant stored data are application dependent and stated into the Performance specifications.

### 1.2.2 Performance Criteria for Compliance: EN 50121-1 (only for EMC)

**Performance criterion A:** The apparatus shall continue to operate as intended during and after the test. No degradation of performance or loss of function is allowed below a performance level specified by the manufacturer, when the apparatus is used as intended. The performance level may be replaced by a permissible loss of performance. If the minimum performance level or the permissible performance loss is not specified by the manufacturer, either of these may be derived from the product description and documentation, and from what the user may reasonably expect from the apparatus if used as intended.

**Performance criterion B:** The apparatus shall continue to operate as intended after the test. No degradation of performance or loss of function is allowed below a performance level specified by the manufacturer, when the apparatus is used as intended. The performance level may be replaced by a permissible loss of performance. During the test, degradation of performance is however allowed. No change of actual operating state or stored data are allowed. If the minimum performance level or the permissible performance loss is not specified by the manufacturer, either of these may be derived from the product description and documentation, and from what the user may reasonably expect from the apparatus if used as intended.

**Performance criterion C:** Temporary loss of function is allowed, provided the function is self-recoverable or can be restored by the operation of the controls.

## 2. Characteristic Test

### 2.1 Visual Inspection and Performance test

#### 2.1.1 Requirement:

The visual inspection shall be carried out to ensure that the equipment construction meets its specified requirements.

The performance test verifies the functional requirements of the Electronic Equipment. The performance test is carried out according to the Performance test specification and Performance test procedure written by the supplier either for type test or for routine test.

#### 2.1.2 Test Procedure

Test Procedures were referred to EN 50155 sub-clause 13.4.1 and 13.4.2

#### 2.1.3 Test Result

Date : 2020/12/18	Temperature : 25 °C	Engineer : SAWYER

## 2.2 Power supply test (Supply variation and temporary supply dips)

### 2.2.1 Test Setup

### 2.2.2 Test Procedure

Test Procedures were referred to EN 50155 sub-clause 13.4.3.2, 13.4.3.3, 5.1.1.2 & 5.1.1.3

### 2.2.3 Test Requirement

☒ D.C. supplied equipment:

Test performed to prove correct functioning at nominal supply voltage and at the upper and lower limits of specified voltage as defined below:

Minimum Continuous voltage:  $0.7 U_n$

Maximum Continuous voltage:  $1.25 U_n$

Voltage fluctuations (e.g. during start-up of auxiliary equipment or voltage oscillations of battery chargers) lying between  $0.6 U_n$  and  $1.4 U_n$  and not exceeding 0.1 s shall not cause deviation of function (performance criterion A).

For temporary supply overvoltages up to  $1.4 U_n$  lasting no more than 1 s the equipment shall fulfil performance criterion B.

☐ A.C. supplied equipment:

Test performed to prove correct functioning at:

Nominal voltage and frequency;

The upper and lower limits of voltage and frequency are in all combinations.

### 2.3.1 Test Setup

### 2.3.2 Test Procedure

Test Procedures were referred to EN 50155 sub-clause 13.4.3.4 & 5.1.1.2

### 2.3.3 Test Requirement

Interruptions of input voltage as defined below:

Class	Requirements	Duration of the interruption time $T_{int}$
S1	No performance criterion is requested but the equipment shall continue to operate as specified after the voltage interruption.	This test is not required.
S2	The equipment shall behave according performance criterion A.	10 ms
S3	The equipment shall behave according performance criterion A.	20 ms

## 2.5 Insulation Test

### 2.5.1 Test Procedure

Test Procedures were referred to EN 50155 sub-clause 13.4.9

### 2.5.2 Test Requirement

#### ☒ Insulation measurement Test: 500VDC

The insulation resistance test carried out at 500 VDC and the values recorded.

The test repeated after the voltage withstand test.

Test acceptance requirements:

There shall be no fundamental deterioration from the initial measurement.

#### ☒ Voltage withstand test:

Nominal battery voltages and/or I/O voltage	Test Voltage
$< 72\text{Vdc}$ or $50\text{Vac}_{\text{rms}}$	500Vac or 750Vdc
$72\text{Vdc} \leq \text{Vdc} < 125\text{Vdc}$ or from 50 to 90 $\text{Vac}_{\text{rms}}$	1000Vac or 1500Vdc
$125\text{Vdc} \leq \text{Vdc} < 315\text{Vdc}$ or from 90 to 225 $\text{Vac}_{\text{rms}}$	1500Vac or 2200Vdc

Test acceptance requirements:

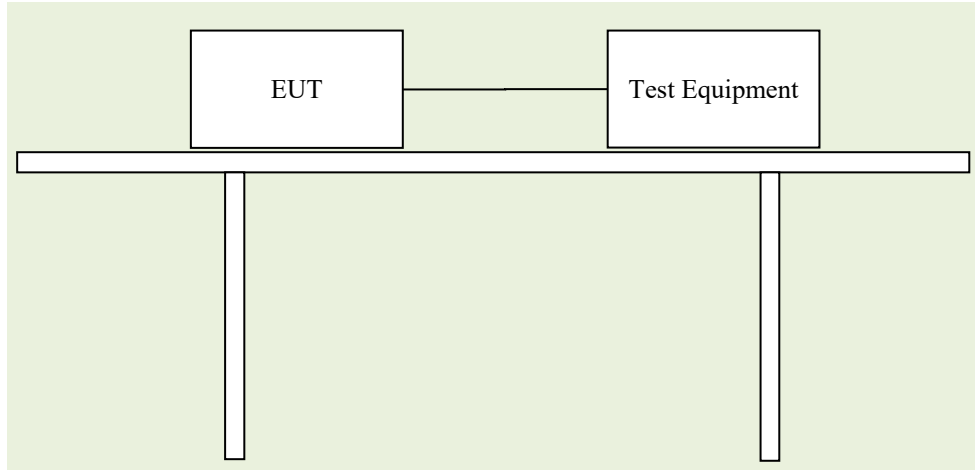

Neither disruptive discharge nor flashover shall occur.

## 2.6 DC ripple factor

### 2.6.1 Test Setup

### 2.6.2 Test Procedure

Test Procedures were referred to EN 50155 sub-clause 5.1.1.6

### 2.6.3 Test Requirement

Test performed to prove correct functioning at nominal supply voltage and at the upper and lower limits of specified voltage as defined below:

$$\text{DC Ripple Factor (\%)} = \frac{U_{\max} - U_{\min}}{2U_n} \times 100 \text{ approximately } \frac{U_{\max} - U_{\min}}{2U_{\max} + U_{\min}} \times 100$$

Maximum Peak to Peak Voltages with a DC Ripple Factor of 5 % as defined below:

Nominal Voltage ( $U_n$ )	Maximum Peak to Peak ripple allowed (V)	Umax (V)	Umin (V)	DC Ripple factor (%)
24	2,4	25,2	22,8	5 %
36	3,6	37,8	34,2	5 %
48	4,8	50,4	45,6	5 %

### 3. Electromagnetic Compatibility (EMC)

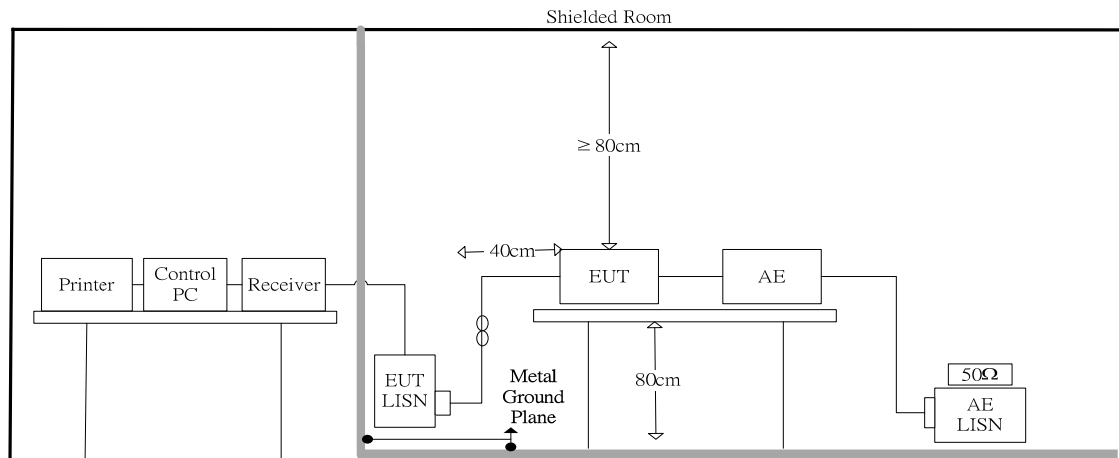

Test Procedures were referred to EN 50155 sub-clause 13.4.8.

All EMC tests of the electronic equipment shall be carried out according EN 50121-3-2.

#### 3.1 Power Main Port Conducted Emissions

##### 3.1.1 Test Setup and Procedure

##### 3.1.2 Test Setup

##### 3.1.3 Test Procedure

The measurements are performed in a shielded room site; The EUT was placed on non-conduction 1.0m x 1.5m table, which is 0.8 meters above an earth-grounded.

Power to the EUT was provided through the LISN which has the Impedance (50ohm/50uH) vs. Frequency Characteristic in accordance with the standard. Powers to the LISNs were filtered to eliminate ambient signal interference and these filters were bonded to the ground plane. Peripheral equipment required to provide a functional system (support equipment) for EUT testing was powered from the second LISN through a ganged, metal power outlet box which is bonded to the ground plane at the LISN.

The interconnecting cables were arranged and moved to get the maximum measurement. Both the line of power cord, hot and neutral, were measured. All of the interface cables were manipulated according to EN 55016-2-1 / CISPR 16-2-1 requirements.

The highest emissions were analyzed in details by operating the spectrum analyzer in fixed tuned mode to determine the nature of the emissions and to provide information which could be useful in reducing their amplitude.

### 3.4 Radiated Disturbance Emissions

#### 3.4.1 Test Setup and Procedure

#### 3.4.2 Test Setup

The 3dB beam width of the horn antenna used for the test is as shown in the table below.

Frequency (GHz)	E-plane	H-plane	$\theta_{3dB}(\text{min})$	d= 3 m
				w (m)
1	88°	147°	88°	5.79
2	68°	119°	68°	4.04
3	73°	92°	73°	4.44
4	70°	89°	70°	4.20
5	55°	60°	55°	3.12
6	63°	62°	62°	3.60

### 3.4.3 Test Procedure

The radiated emissions test will then be repeated on the open site or chamber to measure the amplitudes accurately and without the multiple reflections existing in the shielded room. The EUT and support equipment are set up on the turntable of one of 10 meter open field sites or 10 meter chamber. Desktop EUT are set up on a wooden stand 0.8 meter above the ground or floor-standing arrangement shall be placed on the horizontal ground reference plane. The test volume for a height of up to 30 cm may be obstructed by absorber placed on the ground plane.

For the initial measurements, the receiving antenna is varied from 1-4 meter height and is changed in the vertical plane from vertical to horizontal polarization at each frequency. The highest emissions between 30 MHz to 1000 MHz were analyzed in details by operating the spectrum analyzer and/or EMI receiver in quasi-peak mode to determine the precise amplitude of the emissions. The highest emissions between 1 GHz to 6 GHz were analyzed in details by operating the spectrum analyzer in peak and average mode to determine the precise amplitude of the emissions.

At the highest amplitudes observed, the EUT is rotated in the horizontal plane while changing the antenna polarization in the vertical plane to maximize the reading. The interconnecting cables were arranged and moved to get the maximum measurement. Once the maximum reading is obtained, the antenna elevation and polarization will be varied between specified limits to maximize the readings. All of the interface cables were manipulated according to EN 61000-6-4 requirements.

The highest internal source of an EUT is defined as the highest frequency generated or used within the EUT or on which the EUT operates or tunes. If the highest frequency of the internal sources of the EUT is less than 108 MHz, the measurement shall only be made up to 1 GHz. If the highest frequency of the internal sources of the EUT is between 108 MHz and 500 MHz, the measurement shall only be made up to 2 GHz. If the highest frequency of the internal sources of the EUT is between 500 MHz and 1 GHz, the measurement shall only be made up to 5 GHz. If the highest frequency of the internal sources of the EUT is above 1 GHz, the measurement shall be made up to 5 times the highest frequency or 6 GHz, whichever is less.

\* Note:

Margin = Emission – Limit

Emission = Radiated Amplitude + Correct Factor

Correct Factor = Antenna Correction Factor + Cable Loss – Pre-Amplifier Gain

A margin of -8dB means that the emission is 8dB below the limit

Antenna Distance: 3 meters

Above 1GHz test, if the peak measured value meets the average limit, it is unnecessary to perform the average measurement.

#### 3.7.1 Test Specification

Port:	Enclosure
Basic Standard:	EN 61000-4-2/ IEC EN61000-4-2 (details referred to Sec 1.2)
Test Level:	Air +/- 2 kV, +/- 4 kV, +/- 6 kV, +/- 8 kV Contact +/- 4 kV, +/- 6 kV
Criteria:	B
Test Procedure	refer to ISL QA -T4-E-S7

#### Selected Test Point

Air: discharges were applied to slots, aperture or insulating surfaces. 10 single air discharges were applied to each selected points.

Contact: 10 discharges to the selected contact points.

Indirect Contact Points: 10 discharges were applied to center of one edge of VCP and each EUT side of HCP with 10 cm away from EUT.

Energy-Storage Capacitor:150 pF; Discharge Resistor:330  $\Omega$

#### 3.7.2 Test Setup

EUT is 1m from the wall and other metallic structure. When Battery test mode is needed, a cable with one 470K $\Omega$  resister at two rare ends is connected from metallic part of EUT and screwed to HCP.

#### 3.7.3 Test Result

**Performance of EUT complies with the given specification.**

**2. Voltage Withstand test**

500Vac or 750Vdc for nominal battery voltages below 72 Vdc (or 50 Vac).  
 1000Vac or 1500Vdc for nominal battery voltage from 72Vdc up to 125Vdc, (or from 50 to 90 Vac), and  
 1500Vac or 2200Vdc for nominal battery voltage above 125Vdc and up to 315Vdc, (or from 90 to 225 Vac).  
 Neither disruptive discharge nor flashover shall occur

Test item	Test Voltage	Test Time	Result	Comments
Primary side to secondary side	1200Vdc	1 min	0.01mA	Pass

Supplementary information: Test is only for the sample monomer.

## 5.2 Appendix B: Uncertainty of Measurement

The laboratory measurement uncertainty accordance with refers to CISPR 16-4-2. If  $U_{lab}$  is less than or equal to  $U_{cisp}$  in Table 1, then the test report may either state the value of  $U_{lab}$  or state that  $U_{lab}$  is less than  $U_{cisp}$ .

The coverage factor  $k = 2$  yields approximately a 95 % level of confidence.
