☒ Voltage changes measured at a norm impedance according the „Voltage Method“

$R_A = 0.24\Omega$ / $X_A = 0.15\Omega$ at 50Hz

$R_N = 0.16\Omega$ / $X_N = 0.10\Omega$ at 50Hz

☐ Voltage changes measured according with the „Current Method“ - Precompliant.

☒ Voltage changes caused by hand.

- dc < 3.3%

- dmax < 4.0%

- d(t) < 500ms

The observation time for one cycle is 1 minute.

☐ Voltage changes, flicker caused by program

- dc < 3.3%

- dmax < 6.0%

The test level was increased step by step, starting from the lowest up to the given severity level, to evaluate the fault level. Minimum 10 discharges, with the most critical polarisation and level, were applied to the selected locations
All used test equipment are calibrated periodically.

Operation mode:

EUT arrangement: ☒ Tabletop ☐ Floor standing

Continuous operation at 2.5A load. During the test the output voltage and the “DC OK” voltage were observed.

Environmental conditions:

Temperature: 15 - 35 °C
Humidity: 30 - 60 %
Air pressure: 860 - 1060 hPa

The environmental conditions during the test: ☒ were kept
☐ were not kept

Criterion B:

After the immunity test the EUT must work as intended. During the immunity test, there is some degradation of the performance allowed, but no change of the given working mode. The output voltage must be kept in the range of $\pm 5\%$.
