## TOP-200 Series move noise

Product Series:	<b>TOP-200 Series</b> AC/DC Power Supply, 200 watt (Open Frame)
-----------------	--

When you move an unenergized TOP-200 Series Power Supply, it is possible that you can hear some mechanical noise. This sound is generated by the assembled transformer. Due to the construction and the tolerance of the transformer, the loose ferrite core can move on the bobbin. This circumstance can generate this sound.

This noise should have no impact to the performance of the TOP-200 Series power supplies. The power supply should work as defined in the datasheet.
